

Foster Care Software

Welligent's helps family service organizations improve health outcomes for children in foster care. We provide a comprehensive cloud-based EHR for managing all aspects of the foster care continuum from recruitment through adoption.

Key tools and functions included in our foster care software are used to recruit foster parents, track life events, schedule appointments and find beds within a home. Welligent's assessment and screening tools facilitate the placement of children into safe and appropriate environments.

Welligent's foster care software aids in the tracking and maintenance of foster children's electronic health records and their overall well-being in the foster care system.

Key Features

- Track calls & record home details
- Complete screening tools and required forms
- Set parent, home and child preferences
- Search complex criteria for appropriate child-home matching
- Track parent payments

Recruitment

Welligent's Recruitment Module allows user to:
